RAG Test Document: Solar Energy

Introduction

Solar energy is energy that comes from sunlight. Solar panels convert sunlight into electricity using photovoltaic cells.

Benefits of Solar Energy

Solar energy is renewable, produces no air pollution while generating electricity, and can reduce electricity bills over time. It is useful for homes, schools, and businesses.

How Solar Panels Work

When sunlight hits photovoltaic cells, the cells generate direct current (DC) electricity. An inverter changes DC electricity into alternating current (AC), which many household devices use.

Maintenance

Solar panels work best when their surfaces are kept reasonably clean and they are installed where they receive enough sunlight. A technician should inspect the system if its performance drops unexpectedly.

Quick Facts

1. Solar energy comes from the Sun.
2. Photovoltaic cells convert sunlight into electricity.
3. An inverter converts DC electricity into AC electricity.
4. Solar energy is renewable.
